Original survey information

Name of survey Institution responsible	-
Institution responsible	Encuesta de Condiciones de Vida (ECV) / Survey on income and living Conditions (EU- SILC)
	National Statistical Office (Instituto Nacional de Estadística - INE), www.ine.es
Main objective	Systematic production of Community statistics on income and living conditions, that include transversal and longitudina
	data that are comparable and updated on income, the level and composition of poverty and social exclusion, on a national
	and European level.
Survey structure	Rotating panel survey: the sample is composed by 4 independent panel subsamples, each of which remains in the survey
	for four years and then is replaced by a new one. Priority is granted to the production of high-quality transversal data as
	regards punctuality and comparability.
Frequency	Annual (each year is denominated a survey cycle)
Survey year / Wave	2005 survey
Coverage	All private (non-group, non-institutional) households in Spain and overseas territories (Ceuta, Melilla, Canarias).
Sampling	
Sampling design	The sample is rotating, with a quarter of the sample renewed each cycle (year). Each subsample is selected using a two-
	stage design with first stage unit stratification is used. The first stage is formed by census sections (grouped into 6 strata
	according to size of municipalities within each of the 18 Autonomous Community) selected within each stratum with a
	probability proportional to their size, and the second stage by main family dwellings selected with equal probability (via
	random start systematic sampling).
Sampling frame	First stage unit: area framework formed by the relation of existing census sections used in the 2003 Municipal Register of
r c	Inhabitants.
	Second stage unit: list of main family dwellings in each of the sections selected.
Final sample size	The theoretical sample includes about 16,000 dwellings distributed in 2,000 census sections. The effective sample
i inai sumple size	includes 13,026 interviewed households.
a n	includes 15,020 interviewed households.
Collection	Angli Jan 2005
Collection period	April - June 2005
Instruments and main	There are 3 questionnaires:
contents	- Household File: individual-level information for all roster persons: indentifiers, survey membership status and
	citizenship for everyone, birth year/month, sex and main usual activity for former household members, presence in
	household, presence of parents/partner in household, labour force status and eligibility status for current household
	members, and hours in care for children aged 12 or below currently household members;
	- Household Questionnaire: household level information for all sample households: identifiers (including identification of
	the household respondent), characteristics of main dwelling (including dwelling type, tenure, mortgage information,
	imputed/actual rent, housing expenditures, housing subsidies), household equipment, subjective well-being, household
	economic situation (including Social Assistance income, rental income, transfers between households, wealth taxes,
	income received by children under 16);
	- Individual Questionnaire: individual-level information for all household members aged 16 or above on December 31st
	of the year prior to the interview: iddentifiers, activity (including current main activity and LFS, characteristics of
	last/current main job, other jobs, yearly calendar of activities), personal incomes in reference year (including income from
1	dependent work, firm vehicle use, income from independent work, capital income, income from and and contributions to
	private - non employer-related - pension schemes, incomes from social benefits, income taxes), other personal
	information (including health status, access to health care, biographic information, education, work experience); in 2005
	there was an additional module on intergenerational transmission of poverty.
Definitions	
Household	The private household is defined as the person or persons who occupy a main family dwelling or part of it in common
	and consume and/or share food or other goods on the same budget. Group households and institutions are not included
	in the survey.
Household head	ECV does not use the term head of household but the household respondent (person to be interviewed in the initial
	contact who will provide general information about the household instead. The ideal "household respondent" is
	considered to be the person responsible for the dwelling (i.e. the household member whose name is on the property deed
	or the (sub)lease contract; in case there is more than one, the eldest); if this is not possible, it should be another adult
	household member who can "speak on behalf of" the household; in exceptional cases, teh respondent could be a person
	who is not a member of the household (e.g. an offspring or close friend who is perfectly aware of the household in case
	who is not a member of the household (e.g. an offspring or close friend who is perfectly aware of the household in case
Data quality aspects	who is not a member of the household (e.g. an offspring or close friend who is perfectly aware of the household in case
