rreneric innormanon	
Generic information Name of survey	Household Budget Survey / Badania Budzetow Gospodarstw Domowych
Responsible institution	Central Ststistical Office / Glowny Urzad Statystyczny (GUS), www.stat.gov.pl
Main objective	To measure with utmost accuracy expenditures, consumption and income of Polish households.
Structure of data source	Cross-sectional, with monthly rotation of households.
Frequency	Annual
Survey year / Wave	2007 survey
Coverage	All households in the national territory, with the exception of collective households (e.g. students' hostels, social welfare homes) and
G II	household of foreigners.
Sampling Sampling procedure	The main sample is composed of two sub-samples, each of which is completely renewed every other year (while the other is re-used for
	the second time). Both sub-samples were selected with a geographically stratified two-stage sampling scheme, with area survey points
	selected at the first stage (stratified by class of locality for each voivodship) and dwellings selected at the second stage. The selection of
	dwellings during the second stage was done according to the following rules: i) the adopted model is full rotation with a monthly
	replacement of the sample; ii) for each month 2 dwellings per area survey point are selected and all the households from these dwellings
	participate in the survey; iii) every selected dwelling participates in the survey in the same month for two consecutive years; iv) for every
	area survey point a reserve sample of dwellings is selected in order to replace dwellings inhabited by non participating households (using
	the sequential sampling). First stage sampling frame: records of statistical areas (sets of areas) designed for the National Census purposes and updated annually by
	the changes resulting from the administrative division of the country as well as construction of new and dismantle of old houses.
	Second stage sampling frame: registers of inhabited dwellings in the selected area survey points, prepared by the regional statistical
	offices.
Sample size	37,366 households.
Collection Collection period	January to Documber 2007
Collection period Collection mode	January to December 2007. Interview (CAPI) and diaries.
Description of instruments	The survey instruments include:
	- a monthly Budget Diary, in which all household expenditures and incomes (monetary and non-monetary) are reported; more precisely:
	i) number of meals consumed; ii) the monetary and non-monetary household expenditures; iii) the monetary and non-monetary
	expenditures concerning the private farm; iv) the value of products taken from the private farm in agriculture or self-employment to
	satisfy household's needs as well as goods produced in an individual farm and transferred outside the household; v) the monetary incomes
	received during the month, with a link to the household member connected to each of them;
	- a series of household questionnaires, including:
	i) the Household Statistical Sheet, which records the main characteristics of the dwelling and - if applicable - of the private farm, the main socio-demographic characteristics of all household members and the labour market characteritics of household members aged 15 and
	above, as well as information on subjective well-being, at time of interview; ii) the Additional Household Questionnaire, which records
	information on equipment of durable goods and real estate and on quarterly "rare" expenditures (e.g. cars, household equipment, etc.);
	and iii) the household questionnaire about the non-monetary incomes from employer.
